# CSE 12 — Basic Data Structures and Object-Oriented Design Lecture 4

Greg Miranda & Paul Cao, Winter 2021

#### Announcements

- Quiz 4 due Wednesday @ 8am
- PA1 due Wednesday @ 11:59pm

Survey 2 7 doe Friday

## Topics

Lecture 4 Exercises

→ Implement ArrayList Insert/Remove

```
int size();
/* Add an element at the specified index */
                                             We didn't plan to implement them at
void insert(int index, String s);
                                             that time and commenting out them
/* Remove the element at the specified index */
void remove(int index);
                                            will make our code cleaner
                                             We didn't plan to implement them and
                                             commenting them out will avoid a
                                             compiler error
                                             We were overloading those two
                                             methods
                                            None of the above
```

Why?

During the pre-lecture recording, we

commented out insert and remove method.

Ipublic interface StringList {

void add(String s);

String get(int index);

/\* Add an element at the end of the list \*/

/\* Get the number of elements in the list \*/

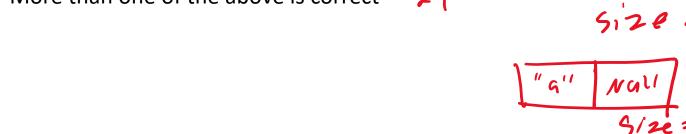

/\* Get the element at the given index \*/

#### In the ArrayStringList class, we have the following fields

```
String[] elements;
int size;
```

What's the point of having size as instance variable as the array elements already has size?

- A. It is duplicate information for ease of use
- B. It avoid calling element.length to save time
- C.) size indicates how full the array is
  D. More than one of the above is correct

$$|ensf_1=2|$$

$$|null| |null|$$

$$|size=0|$$

```
In the ArrayStringList class, we have a private helper method expandCapcity
private void expandCapacity() {
    int currentCapacity = this.elements.length;
    if(this.size < currentCapacity) { return; }</pre>
    String[] expanded = new String[currentCapacity *
    for(int i = 0; i < this.size; i += 1) {</pre>
        expanded[i] = this.elements[i];
    this.elements = expanded;
If I have a foo function inside the ArrayStringList class and have the following code
what will be printed out? Assume that the array starts empty and has a capacity of 2.
public void foo() {
                                                             true
     String[] tmp = elements;
    add("a"); add("b"); add("c");
                                                      13 \mathcal{L} there will be a compiler error
     expandCapacity();
                                                             there will be a runtime error
     System.out.println(tmp == elements);
```

```
In the ArrayStringList class, we have a private helper method expandCapcity
private void expandCapacity() {
   int currentCapacity = this.elements.length;
   if(this.size < currentCapacity) { return; }

String[] expanded = new String[currentCapacity * 2];</pre>
```

```
for(int i = 0; i < this.size; i += 1) {
    expanded[i] = this.elements[i];
}

this.elements = expanded;
}

When do I need to call this expandCapacity function?

A. Inside the constructors 4

B. Inside the insert method 7 2

C. Inside the remove method 0</pre>
```

D. Inside the get method  $\circ$ 

4nside the add method

```
StringList slist = new ArrayStringList();
slist.add("paul");
slist.add("greg");

assertEquals("paul", slist.get(0));
assertEquals("greg", slist.get(1));

In our tester for add, we wrote the code for inserting two elements and test if we added properly. Can I write my tester as
```

public void testAdd() {

assertEquals(slist.get(0), "paul");
assertEquals(slist.get(1), "greg");

7A. Yes they are basically the same as what we wrote in pre-lecture video

No you can't switch the order as it will generate the wrong test result

No you can't switch the order as it makes the interpretation of the test result inaccurate

# StringList Interface

```
public interface StringList {
 /* Add an element at the end of the list */
 void add(String s);
 /* Get the element at the given index */
  String get(int index);
  /* Get the number of elements in the list */
 int size();
 /* Add an element at the specified index */
  void insert(int index, String s);
 /* Remove the element at the specified index */
 void remove(int index);
```

### ArrayList Insert

```
/* Add an element at the specified index */
void insert(int index, String s);
```

- Write a test case for the ArrayList insert method
- Implement the ArrayList insert method

## ArrayList Remove

```
/* Remove the element at the specified index */
void remove(int index);
```

- Write a test case for the ArrayList remove method
- Implement the ArrayList remove method
