CSE 12 – Basic Data Structures and Object-Oriented Design
Lecture 6

Greg Miranda & Paul Cao, Winter 2021

This lecture is being recorded

Announcements

- Quiz 6 due Wednesday @ 8am

- Survey 2 due tonight @ 11:59pm

- PA2 released yesterday – closed PA

- Monday – Holiday
  - No class
  - No quiz due

Topics

- Generics & Exception Exercises

Generics and Exceptions

Java Generics

```
public interface Collection<E> extends Iterable<E>
```

What does the <E> mean in the above code?

A. That this collection can only be used with objects of a built-in Java type called E

B. That an object reference that implements Collection can be instantiated to work with (almost) any object type

C. That a single collection can hold objects of different types

Java Generics

Java Generics use parameterized types in class definitions

```java
public class RecentRememberer<T> {
  private ArrayList<T> elements;

  public RecentRememberer()
  {
    elements = new ArrayList<T>();
  }

  public T add( T element )
  {
    …
  }
}
…
```

Type parameter

Java Generics

Java Generics use parameterized types in class definitions

```
public class RecentRememberer<T> {
  private ArrayList<T> elements;

  public RecentRememberer() {…}
  public T add(T element) {…}
  public int getNumElements() {…}
  public T getLastElement() {…}

}
```

Type parameter

Java Generics

```
public class RecentRememberer<T> {

  private ArrayList<T> elements;

  public RecentRememberer()
  {
    elements = new ArrayList<T>();
  }

  public T add( T element )
  { …
}
…
```

Handwritten annotations:

reference

private *T [] data; // ?? ✓✓*

reference

Can't do *new E[5];*

Is this line legal Java code?
A. Yes
B. No

Java Generics

```java
public class RecentRememberer<T> {

    private ArrayList<T> elements;

    public RecentRememberer()
    {
        elements = new ArrayList<T>();
    }

    public T add( T element )
    { …
}
…
```

T can be used to stand for a type (to be specified later anywhere in this class (and its inner classes!)

Java Generics

```java
public class RecentRememberer<T> {
  private ArrayList<T> elements;

  public RecentRememberer() {…}
  public T add(T element) {…}
  public int getNumElements() {…}
  public T getLastElement() {…}

  public static void main(String[] args) {
    RecentRememberer<T> rr = new RecentRememberer<T>();
    RecentRememberer<T> rr2 = new RecentRememberer<T>();
    rr.add(1);
    rr.add(2);
    rr2.add("three");
    System.out.println(rr.getNumElements() + "elems added");
    System.out.println("Last elem was " + rr.getLastElement());
  }
}
```

Will the main method compile?
A. Yes
B. No

Create an object from generic class, must supply real type.

Java Generics

```
public class RecentRememberer<T> {
  private ArrayList<T> elements = new ArrayList<T>();

  public RecentRememberer() {…}
  public T add(T element) {…}
  public int getNumElements() {…}
  public T getLastElement() {…}

  public static void main(String[] args) {
    RecentRememberer<Integer> rr = new RecentRememberer<Integer>();
    RecentRememberer<String> rr2 = new RecentRememberer<String>();
    rr.add(1);
    rr.add(2);
    rr2.add("three");
    System.out.println(rr.getNumElements() + "elems added");
    System.out.println("Last elem was " + rr.getLastElement());
  }
}
```

Will the main method compile?
A. Yes
B. No

A few Notes

You are not allowed to use Generics as follows

- In creating an object of that type:
  ```
  new T() // error
  ```
- In creating an array with elements of that type:
  ```
  new T[100] // error
  ```
- As an argument to instanceof:
  ```
  someref instanceof T // error
  ```

) Compiler error

- Note: To ensure that certain methods can be called, we can constrain the generic type to be subclass of an interface or class
  ```
  public class MyGenerics <E extends Comparable>{ .........}
  ```

Some quick words on Generics

- Important for data structures in general
  - ```
   public class MyList<E>{
         //codes that use E
     }
    ```

$$E[] \ ref = (E[]) (new \ Object(5));$$

- Type erasure during compile time
  - Compiler checks if generic type is used properly. Then replace them with Object
  - Runtime doesn't have different generic types
  ```
  MyList<String> ref1 = new MyList<String>();
  MyList<Integer> ref2 = new MyList<Integer>();
  ```

  - Compile time

  - Runtime

# More words on generics

- Pro
  - Avoid type casting (i.e. limit runtime errors)

  Before Java 5
  ```
  ArrayList list = new ArrayList();// a list of objects
  list.add("paul")
  list.add(new Integer(12));

  Integer data = list.get(1);
  ```

- Con
  - Type erasure

# Generics

- Convert LinkedStringList to be a generic

```java
public interface List<Element> {
  /* Add an element at the end of the list */
  void add(Element s);

  /* Get the element at the given index */
  Element get(int index);

  /* Get the number of elements in the list */
  int size();
}

class Node {
  String value;
  Node next;
  public Node(String value, Node next) {
    this.value = value;
    this.next = next;
  }
}
```

```java
public class LinkedStringList implements StringList {
  Node front;
  int size;

  public LinkedStringList() {
    this.front = new Node(null, null);
    this.size = 0;
  }

  public String get(int index) {
    Node temp = this.front.next;
    for (int i = 0; i < index; i += 1) {
      temp = temp.next;
    }
    return temp.value;
  }

  public int size() {
    return this.size;
  }

  public void add(String s) {
    Node temp = this.front;
    while (temp.next != null) {
      temp = temp.next;
    }
    temp.next = new Node(s, null);
    this.size += 1;
  }
}
```

Exceptions

- What happens if an invalid index is passed to get()?
- Modify get() to throw an exception if the index is invalid

```java
public String get(int index) {
    Node temp = this.front.next;
    for (int i = 0; i < index; i += 1) {
      temp = temp.next;
    }
    return temp.value;
  }
```

- Write a test to verify get() throws an exception with an invalid index

```java
import static org.junit.Assert.assertEquals;
import org.junit.Test;

public class TestList {

  @Test(expected = IndexOutOfBoundsException.class)
  public void testNegativeIndex() {
    List<String> slist = new AList<String>();
    slist.add("banana");
    slist.get(-1);
  }

}
```
